

Detailed Report

Model Config: selfie_segmentation_config_0

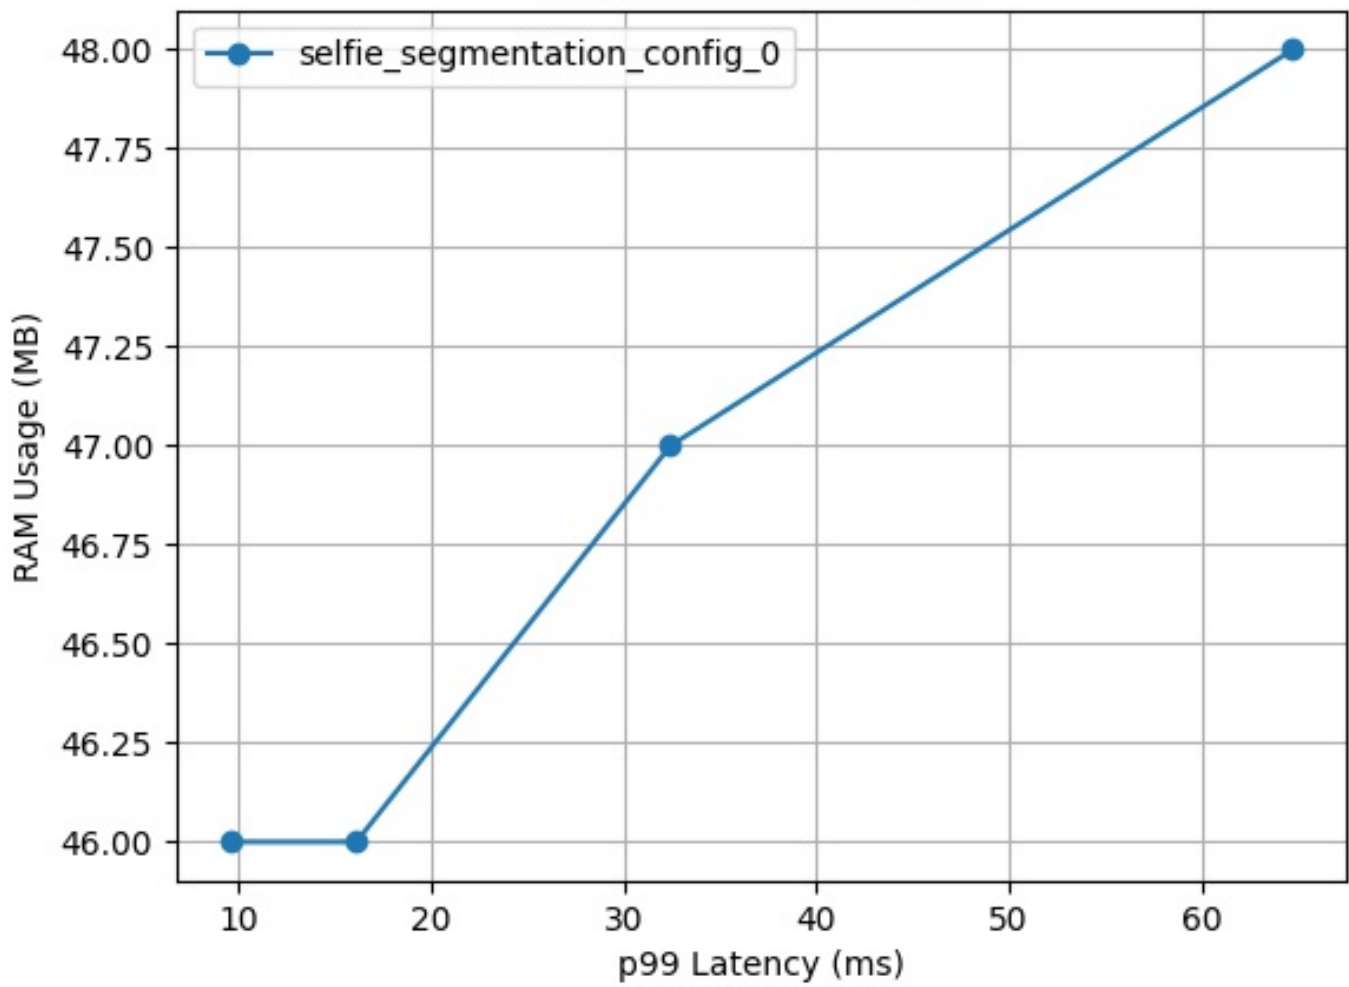

Latency Breakdown for Online Performance of selfie_segmentation_config_0

Request Concurrency	p99 Latency (ms)	Client Response Wait (ms)	Server Queue (ms)	Server Compute Input (ms)	Server Compute Infer (ms)	Throughput (infer/sec)	Max CPU Memory Usage (MB)
8	64.727	57.825	50.179	0.031	7.128	137.274	48.0
4	32.426	28.786	21.274	0.03	7.109	138.086	47.0
2	16.121	14.569	6.969	0.031	7.217	136.064	46.0
1	9.55	7.602	0.025	0.031	7.223	129.862	46.0

The model config **selfie_segmentation_config_0** uses 1 CPU instance with a max batch size of 0 and has dynamic batching disabled. 4 measurement(s) were obtained for the model config on CPU. This model uses the platform .

The first plot above shows the breakdown of the latencies in the latency throughput curve for this model config. Following that are the requested configurable plots showing the relationship between various metrics measured by the Model Analyzer. The above table contains detailed data for each of the measurements taken for this model config in decreasing order of latency.

RAM Usage vs. Latency
